Tange Prestige Tubing
Prestige is a high grade chrome molybdenum tubing which is subjected to a special Tange heat treating process. The result is a very light high-strength tube for performance oriented bicycles.

Tange Oversize Tubing
Large outside diameter of Tange Oversize provides significant increase in strength with a minimal weight increase. Tange Oversize makes a more rigid and efficient frame.

Tange Taper-Butted Tubing
Tange Prestige OS mountain bike tubing features double butted construction. The difference is that one butt utilizes a tapered design in which the wall thickness of the butt itself tapers toward the center of the tube. A stronger joint is realized from a very lightweight tube.

Taper butted tubes maintain joint strength while decreasing the weight of the tube set.

Short Butt Taper Tubing
Tange offers short tapered butts on tubing specified for TIG welded frames. The length of the butt can be effectively reduced due to the shorter heating time utilized with TIG welding.

Bulge Butting
Bulge butting adds material to the outside of the tube at the top of the seat tube and at the fork stem in order to increase tube strength at the joint. Bulge butting eliminates the need for additional reinforcing pieces.

THE TANGE FRAME EMBLEM—YOUR PROOF OF QUALITY

MTB Tubing
Prestige doubled butted seamless MTB tubing with oversize outside diameter. Large but lean... it only looks fat.

Road Tubing
Double butted oversize Cr-Mo tubing add strength and reduce the weight of the best racing bicycle.
